2020

Course Curriculum & Syllabi-2020

POSTGRADUATE DEPARTMENT OF PHYSICS

BERHAMPUR UNIVERSITY, BHANJABIHAR, ODISHA, INDIA

1. About the Department:

The Department of Physics was started in 1969 with a Vision to spread Science and provide higher education. Dr. S.N. Behera was the founder of this Department. The Department offers a two years Master's degree Course in Physics, beside M.Phil and Ph. D. Since its inception the Department has grown appreciably with the leadership of Prof. P. K. Mishra not only in terms of students and faculty strength but also in terms of the introduction of new courses and broadening research activities. The postgraduate curricula have recently undergone significant orientation congruent with the development and trends in different thrust areas, of the subjects like condensed matter physics, materials science, photonics, nuclear Science, nuclear astrophysics, particle physics, cosmology, etc.

The Department made an outstanding contribution to research and published more than 400 papers in reputed international and national journals in the above subjects. The hallmark of the Department is sincere teaching and outstanding research. Several candidates got their Ph.Ds from the Department. Faculty members of this Department Prof. N.C Mohapatra, Prof G.S.Tripathi, and Prof. R .Sahu received the "Samanta Chandra Sekhar award" by Odisha Bigyan Academy for the Years 1996, 2005 and 2010 respectively.

The Department has established a center for applied photonics with the financial support from DST-FIST, to conduct experimental research in the area of photovoltaic and nanomaterials. The Department is also coordinating the center of Excellence for Nano Science and Technology for the development of sensor, a project of Rs three hundred lakhs sanctioned by OHEPEE, Department of higher education, Government of Odisha.

The Department regularly organizes seminars, conferences, summer school /winter school .

Many of its students went abroad for higher studies, and some of them are absorbed in various institutions there. Some of our students are also faculty members in leading national-level institutions and laboratories. This Department is a vibrant place for academics and research.

2. Faculty Members:

1. Sukanta K. Tripathy, Professor
2. Snigdha Mishra, Associate Professor
3. Sidhartha S. Panda, Reader
4. Sashi S. Behera, Assistant Professor
5. Salila Das, Assistant Professor
6. Kusha K. Naik, Assistant Professor

Honorary Professors

1. Gouri S. Tripathi.
2. Rankanidhi Sahu.
3. Chapala Das.

Postdoctoral fellow: Bhaskar C. Behera

3. Facilities in the Department.

Experimental Research: (**Centre for Applied Photonics**). This centre is established with DST FIST funding. This centre consists of 1.Nano Materials Synthesis Laboratory 2.Device Fabrication Laboratory 3.Device Characterization Laboratory. Coating facilities like spin coating, dip coating, vacuum coating are available in this centre. U.V. Visible Spectrophotometer, Keithly Source meter, LCR Meter, Impedance analyzer, Solar Simulator are also available for characterization.

An experimental setup is designed in this centre for the characterization of optical fibre-based sensors.

Theoretical Research: Condensed Matter Physics, High Energy Physics

4. Syllabus:

M.SC.PHYSICS SYLLABI
BERHAMPUR UNIVERSITY

Note: C: Core paper, P: Practical, E: Elective, S: Seminar

A student has to register for 14 core papers (including three core labs), 5 elective papers (including one lab in elective) and one project and seminar.

First Semester

Sub Code: PHYS C101	Mathematical Methods in Physics	
Semester:1	Credit:4	Core Course
Pre-requisites: Basic understanding of real analysis, Complex numbers, Group theory		
Objectives: <ul style="list-style-type: none">✓ To learn about various mathematical tools employed to study physics problems.✓ To get good experience of using and understanding areas like complex variables, Tensor analysis, Group Theory and special functions.✓ To strengthen the analytical abilities of the student and help them to formulate different relationships in mechanics and physics compactly.		

Unit -1

12 hours

Complex Variables: Analytic functions, Contour integrals, Cauchy's integral theorem, Laurent's series, singular points, residues and the Residue Theorem, Evaluation of real definite and indefinite integrals by contour integration, Indented semi-circular contour, evaluation of single and multi-valued functions, branch points and branch cuts, Contour integration involving branch point.

Unit -2

12 hours

Tensors: Introduction, Types of tensor, Invariant tensor, epsilon tensor, Pseudo tensor, the algebra of tensor, Quotient law, Metric Tensor, Covariant derivative of tensor, Fundamental Tensor, Cartesian tensor, Christoffel symbol.

Unit -3

12 hours

Group Theory: Definitions of groups, subgroups and classes, Isomorphism, Homomorphism, Cayley's theorem, Group representations, Orthogonality theorem, characters, Orthogonality

relation for group character, Character table, Preliminary idea about infinite group, calculation of generator, Calculation of generator associated with SU(2) and SO(3) group, Homomorphism between SU(2) and $O^+(3)$ group.

Unit -4

12 hours

Special Functions: Legendre Polynomials, generating functions, Recurrence formulae, Orthogonality properties of Legendre's polynomial of 1st kind, Bessel generating function, Recurrence formulae, Orthogonality properties of Bessel's polynomials, Fourier and Laplace transformation.

Text books:

1. Mathematical Methods of Physics by Mathews and Walker (W. A. Benjamin Inc.)
2. Matrices and Tensors in physics by A. W. Joshi (New Age International Publisher)
3. Mathematical Methods in the physical Science by Mary L. Boas (Wiley- India)

Reference Books:

1. Mathematical Methods for Physicist by G. Arfken and H. Weber, Academic Press (Elsevier)
2. Elements of Group Theory by A. W. Joshi (New Age International Publisher)
3. Mathematical Physics by H. K.Das and Dr. R. Verma (S. Chand & Company LTD.)
4. Mathematical Physics by P. K. Chattopadhyaya (New Age International)

Sub. Code: PHYS C102		Classical Mechanics	
Semester: 1	Credit: 4	Core Course	
Pre-requisites: Basic understanding of generalized co-ordinate, Newtonian dynamics			
Objectives:			
<ul style="list-style-type: none"> ✓ To understand degrees of freedom and dynamics of a rigid body motion. ✓ To understand complex kind of gyroscopic motion as like heavy symmetric top. ✓ To make out a clear distinction of Lagrangian and Hamiltonian dynamics. ✓ To understand Hamiltonian dynamics and evolution of quantum mechanics. ✓ To understand small oscillation occurring in micro and macro-systems 			

Unit-1

10 hours

KINEMATICS OF RIGID BODY MOTION:

Independent co-ordinates of a rigid body, Orthogonal transformations, Eulerian angles, infinitesimal rotations, rate of change of vector, Coriolis force, angular momentum and kinetic energy of motion about a point, inertial tensor and the moment of inertia, Eigen values of Inertial tensor and the principal axis transformation, methods of solving rigid body problems and Euler's equations of motion, torque free motion of a rigid body. Heavy symmetrical top with one point fixed.

Unit-2

10 hours

HAMILTONIAN FORMULATION: Calculus of Variations and Euler-Lagrange's Equation, Brachistochrone Problem, Hamilton's Principle, Extension of Hamilton's Principle to Nonholonomic Systems, Legendre Transformation and the Hamilton Equations of Motion, Physical Significance of Hamiltonian, Derivation of Hamilton's Equations of Motion from a Variational Principle, Routh's Procedure, Principle of Least Action

Unit-3

10 hours

CANONICAL TRANSFORMATIONS: Canonical Transformation, Types of Generating Function, conditions for canonical transformation, Integral Invariance of Poincare, Poisson Bracket, Poisson's Theorem, Lagrange Bracket, Poisson and Lagrange Brackets as Canonical Invariant, Infinitesimal Canonical transformation and Conservation Theorems, Liouville's Theorem Hamilton Jacobi Theory: Hamilton-Jacobi Equation for Hamilton's Principal Function, Harmonic Oscillator and Kepler problem by Hamilton-Jacobi Method, Action-Angle Variables for completely Separable System, Kepler Problem in Action-Angle Variables

Unit-4

10 hours

SMALL OSCILLATION: Problem of Small Oscillations, Example of linear triatomic molecule and two

coupled Oscillator, General Theory of Small Oscillations, Normal Coordinates and Normal Modes of Vibration.

Test Books:

1. Classical Mechanics- by H. Goldstein (Addison-Wesley)

Reference books:

1. Classical Mechanics by S. N. Biswas, Books and Allied Publisher Ltd.
2. Classical Mechanics by J.C. Upadhyay, Himalaya Publishing House.
3. Classical Mechanics by Landau and Liftshitz (Butter Worth)

Sub Code: PHYS C103	Computer Programming and Numerical Analysis	
Semester:1	Credit:4	Core Course
Pre-requisites: Basic knowledge of Computer ,Mathematical Physics		
Objectives:		
<ul style="list-style-type: none"> ✓ To understand the importance of computer application in science and engineering. ✓ To learn and understand basic computer language FORTRAN 77. ✓ To compute and develop algorithms for solution of science and engineering problems. 		

Unit -1

10 hours

Data types, expressions, statements, input and output commands, conditional and interactive constructs, character and data managements, array manipulations, subprogram, subroutine.

Unit -2

12 hours

Numerical integrations by trapezoidal and Simpson method, finding the root of an equation by Newton-Raphson method, finding prime numbers, Runge-Kutta method, interpolation sorting and similar other problems .

Unit -3

12 hours

Solution of simultaneous linear equations, Gaussian elimination, Pivoting, Iterative Method, Matrix Inversion, Root of a transcendental equation by Newton-Rapson Method, Least square fitting.

Unit -4

12 hours

Eigen values and eigenvectors of matrices, power and Jacobi method, Finite Differences, Interpolation with equally Spaced and unevenly spaced points (Newton's and Lagrange's method), Forward and Backward Interpolation, Extrapolation, Numerical Integration by trapezoid and Simpson's rule, Solution of first and second order differential equation using Runge- Kutta (RK-4) method.

Text books:

1. Fundamentals of Computers by V. Rajaraman, Prentice Hall of India Ltd Publishers.
2. Fortran 77 and Numerical Methods by C Xavier, New Age International (P) Ltd Publishers.
3. Numerical Methods in Science and Engineering by S. Rajasekaran, S.chand

Reference Books:

1. Numerical Mathematical Analyses by J. B. Scarborough, Oxford and IBH Publishing Company
2. Numerical methods for engineering and scientific computation by M K Jain (Wiley Eastern
3. Numerical Methods for Scientific and Engineering Computation by MK Jain,SRKlyengar and R Jain, New Age International (P) Ltd Publishers.

Sub Code: PHYS C104	Quantum Mechanics -1	
Semester:1	Credit:4	Core Course
Pre-requisites: : Basic Mathematical Physics		
Objectives:		
<ul style="list-style-type: none"> ✓ To apply quantum mechanics to the dynamics of single particle in one-, two and three- dimensional potentialfields. ✓ To strengthen the analytical abilities of the student and help them to apply it in different branches of physics compactly. 		

Unit –1

14 Hours

GENERAL PRINCIPLES OF QUANTUM MECHANICS:

Postulates of Quantum Mechanics and meaning of measurement, Operators and their expectation values, Schrodinger equation, Particle in a box, Orthogonality of eigen functions. Dirac Notations, Linear vector space, Ket and Bra vectors, Scalar product of vectors and their properties, Dirac delta function, linear operators, Adjoint operators, Unitary Operators, Expectation values of dynamical variables and physical interpretation of Hermitian operators, Eigen values and eigen vectors, orthonormality of eigen vectors, probability interpretation, Degeneracy, Schmidt method of orthogonalisation, Expansion theorem, Completeness and closure properties of the basis set, Coordinate and momentum representations, compatible and Incompatible observables, Commutator algebra, uncertainty relation as a consequence of non- commutability, minimum uncertainty wave packet, Representations of Ket and Bra vectors and operators in matrix form, Unitary transformation of basis vectors and operators.

Unit –2

12 Hours

QUANTUM DYNAMICS:

Time evolution of quantum states, Time evolution operator and its properties, Schrödinger, Heisenberg and Interaction picture, Equations of motion, Operator method solution of

Harmonic oscillator problem, Matrix representation and time evolution of creation and annihilation operators.

Unit-3

12 Hours

ROTATION AND ORBITAL ANGULAR MOMENTUM:

Orbital angular momentum operators as generators of rotation, L_x , L_y , L_z and L^2 and their Commutation relations, Raising and Lowering operators (L_+ and L_-), L_x , L_y , L_z and L^2 in spherical Polar coordinates, Eigen values and Eigen functions of L_z and L^2 (operator method), Matrix representation of L_x , L_y , L_z and L^2 .
12Hours

Unit –4

14 Hours

SPIN ANGULAR MOMENTUM:

Spin $\frac{1}{2}$ particles, Pauli spin matrices and their properties, Eigen values and Eigen functions, Spin and rotations. Total angular momentum: Total angular momentum J , Eigen value problem of J_z and J^2 , Angular momentum matrices, Addition of angular momentum and C. G. coefficients for the states with (i) $j_1 = \frac{1}{2}$ and $j_2 = \frac{1}{2}$ (ii) $j_1 = 1$ and $j_2 = \frac{1}{2}$.

Text books:

1. "Quantum Mechanics: Concepts and Applications" by Nouredine Zettilé John Wiley and sons.

Reference Books:

1. "Quantum Mechanics", L.I. Schiff L.I 3rd Ed, McGraw Hill Book Co.
2. "Quantum Mechanics" E. Merzbacher, 2nd Ed., John Wiley & Sons.
3. "Quantum Physics", S. Gasiorowicz John Wiley.
4. "A Text Book of Quantum Mechanics" by P.M. Mathews . and Venkatesan, Tata McGraw Hill.
5. Introduction to Quantum Mechanics, by D.J. Griffiths, 2nd edition, Pearson Publications

Sub Code: PHYS P105	Computer Programming and Numerical Analysis (Laboratory work)	
Semester:1	Credit:4	Core Course
Pre-requisites: Basic knowledge of computer		
Objectives:		
<ul style="list-style-type: none"> ✓ To learn and practice basic computer language FORTRAN 77. ✓ To program different methods associate with Physics and Engineering 		

1. Numerical integration by trapezoidal method
2. Numerical integration by Simpson method
3. Solution of first and second order differential equation by RungeKutta Method
4. Matrix addition, subtraction, multiplication and manipulation
5. Matrix inversion
6. Finding the roots of an equation by Newton-Rapson method
7. Least square fitting of linear parameters
8. Determination of prime numbers.
9. To arrange a set of numbers in increasing or decreasing order
10. Sum of A.P and G.P series, Sine and Cosine series
11. Factorial of a number
12. Evaluation of log and exponentials by summing of series
13. Any other suitable experiments.

Second Semester

Sub Code: PHYS C201	: Classical Electrodynamics	
Semester:2	Credit:4	Core Course
Pre-requisites: Basic Mathematical Physics, (ii) Classical Electricity and Magnetism.		
Objectives:		
<ul style="list-style-type: none"> ✓ To emphasize electric and magnetic radiation field phenomena and Bremsstrahlung radiation in a Coulomb field and Cherenkov radiation, ✓ Electromagnetic Scattering. 		

Unit –I

14Hours

(a)Covariant formulation of electrodynamics: Covariant form of Maxwell's equation(four vector and tensor form), Maxwell field tensor, covariant definition of electromagnetic energy and momentum, transformation of electromagnetic field components, Lagrangian of a charged particle in an external electromagnetic field.

(b)The Inhomogeneous Wave equation: Wave equations for potentials, solution by Fourier analysis, Radiation field, Radiation energy, Hertz potential, Computation of radiation fields by Hertz method, electric dipole radiation, multipole-radiation.

Unit –II

12 Hours

a) Lienard-Wiechart potential and Field of a uniformly moving electron: Lienard-Wiechart potential, Fields of a charge in uniform motion, Direct solution of the wave equation, Convection potential, Virtual photon concept.

(b) Wave guides, Propagation of electromagnetic waves in rectangular wave guides.

Unit –III

14 Hours

Radiation from Accelerated Charges:

Radiation from an accelerated charge, Fields of an accelerated charge radiation at low velocity, Case of velocity parallel to acceleration, radiation from circular orbits, Radiation with no restrictions on the acceleration or velocity, Classical cross section for bremsstrahlung in a Coulomb field, Cherenkov radiation.

Unit –IV

14 Hours

Radiation, scattering and dispersion:

Radiative damping of a charged harmonic oscillator, forced vibrations, scattering by an individual free electron, scattering by a bound electron, absorption of radiation by an oscillator, equilibrium between an oscillator and a radiation field, effect of a volume distribution of scatters, scattering from a volume distribution, Rayleigh scattering, the dispersion relation.

Text Book:

1. "Classical Electricity and Magnetism" by Wolfgang K.H.Panofsky and Melba Philips ,Second Edition.

Reference books:

- 1"Classical Electrodynamics", Jakson J D, John Wiley.
2. 'Introduction to Electrodynamics", Griffiths D J, Prentice Hall.

Sub Code: PHYS C202	Statistical Mechanics	
Semester:2	Credit:4	Core Course
Pre-requisites: Basic laws of thermodynamics		
Objectives:		
<ul style="list-style-type: none"> ✓ To develop a working knowledge of statistical mechanics. ✓ To learn statistical interpretation of various phenomena like ensembles, ideal systems, photon gas, Low temperature physics and their applications, Bose Einstein condensation, phase transition. ✓ To explore its applications in other branches of physics like material science and the physics of condensed matter. 		

Unit -1

12 Hours

Classical Statistical Mechanics: Postulates of classical statistical mechanics, Lowville’s theorem micro-canonical ensemble, derivation of thermodynamics, equi-partition theorem, Classical ideal gas, Gibb’s paradox, .canonical ensemble, energy fluctuation in canonical ensemble, grand canonical ensemble, density fluctuation in grand canonical ensemble, equivalence of canonical and grand canonical ensemble.

Unit -2**12 Hours**

Quantum Statistical Mechanics: Postulates of quantum statistical mechanics, density matrix, Liouville's theorem, ensembles in quantum statistical mechanics, third law of thermodynamics, Ideal gases in micro-canonical ensemble. Particle in a box, MB, BE and FD distributions. The Ideal Gases in Grand Canonical Ensemble, Equation of state of Ideal Bose Gas, Fermi Gas.

Unit -3**12 Hours**

Fermi Gas: The Equation of state of an Ideal Fermi gas, High temperature and low Densities, Low temperature and High Densities, Theory of White Dwarf Stars, Pauli par magnetism.

Unit -4**12 Hours**

Bose Gas: Ideal Bose gas, Photon, Planck's law, Bose-Einstein condensation. 1st order and 2nd order phase transitions, Ginzburg Landau theory of phase Transition, Ising model (one dimensional Ising model)

Text Book:

1. Statistical Mechanics – K. Huang, Wiley India

Reference books:

1. Statistical Mechanics – Landau and Lifshitz, ButterWorth
2. Statistical Mechanics- R. K. Patheria, P.D. Beale 3rd Ed, Butter Worth-Heinemann
3. Fundamental statistical and thermal Physics- F. Reif, Tata Mc Graw-Hill Edition
4. Elementary statistical mechanics, C. Kittel, Dover Publication

Sub. Code: PHYS C203	Basic Solid State Physics	
Semester: 2	Credit: 4	Core Course
Pre-requisites: Crystal structure, Bragg's Diffraction, Reciprocal lattice space		
Objectives: <ul style="list-style-type: none"> ✓ To understand different bond mechanism. ✓ To understand evolution of phonon and its importance in electrical and thermal properties ✓ To understand FEM and NFEM. ✓ To understand different class of solids. 		

Unit-1**10 hours**

CRYSTAL BINDING: Crystals of inert gases, Ionic crystals, covalent crystals, Metals Lattice Dynamics-Vibrations of a mono atomic linear chain, Vibration of a diatomic linear chain, Dispersion relations, Acoustic and Optic modes, Long-wavelength limits.

Unit-2 10 hours

SPECIFIC HEAT OF INSULATORS:Phonon heat Capacity, Debye model for density of states, Debye T³ law, Einstein's theory of the specific heat Free Electron Fermi gas-Energy levels in one-dimension, Effect of temperature on the Fermi-Dirac distribution function, Free electron gas in three dimension, Heat Capacity of the electron gas, Electrical conductivity and Ohm's law, Motion in magnetic fields, Static magneto-conductivity tensor, Hall effect, Thermal conductivity of metals, Wied man- Franz Law.

Unit-3**10
hours**

Energy bands : Nearly free electron model, origin of the energy gap, Bloch functions, Kronig-Penney model, Wave equation of electron in a periodic potential, restatement of Bloch theorem, solution of the central equation, approximate solution near a zone boundary, number of orbitals in a band, metals and insulators.

Unit-4**10
hours**

SEMICONDUCTOR CRYSTALS: Band gap, Holes, effective mass, intrinsic carrier concentration, intrinsic mobility, impurity conductivity, donor states, acceptor states, thermal ionization of donors and acceptors.

DEFECTS AND DIELECTRICS: Classification of defects, Point defects- Schottky and Frenkel defects, Diffusion and ionic conductivity. Dielectrics-local electric field at an atom, Lorentz field, field of dipoles inside cavity, dielectric constant and polarisability-Claussius-Mossotti relation, Mechanisms of electronic ionic and orientation polarizability.

Test Books:

2. Introduction to Solid State Physics by C. Kittel, 7th edition, (John-Wiley, 1996)

Reference Books:

1. Introduction to the theory of Solid State Physics by J. D. Patterson (Addison-Wesley,1971)
2. Solid State Physics by N. W. Ashcroft and N. D. Mermin , (Harcourt Asia PTE Ltd.)
3. Physics of Condensed Matter by Prasanta K.Misra (Academic Press, 2010)

Sub Code: PHYS C204	QUANTUM MECHANICS-II	
Semester:2	Credit:4	Core Course
Pre-requisites: Basic knowledge in Quantum mechanics-1 and Mathematics to handle model description based on physical laws		
Objectives:		
<ul style="list-style-type: none"> ✓ To learn the properties of molecules and atoms and their constituents—electrons, protons, neutrons, and other more esoteric particles such as quarks and gluons. 		

Unit-1

12 Hours

Motion in a spherically symmetric field:

Hydrogen atom, Reduction to equivalent one body problem, radial equation, Energy eigen values and eigen functions, Degeneracy, Radial probability distribution, free-particle problem, Expression of plane waves in terms of spherical waves .

Unit-2

12 Hours

Approximate methods:

stationary perturbation theory, Rayleigh Schrodinger method for non-degenerate case, first and second order perturbation, an harmonic oscillator, general theory for the degenerate case, removal of degeneracy, linear Stark effect, normal Zeeman effect.

Unit-3

12 Hours

Time-dependent perturbation theory:

- Transition probability, constant and harmonic perturbation, Fermi Golden rule. Variational method: Ground state of He atom.

- W. K. B. method: connection formulas, Bohr-Sommerfeld quantization rule, Harmonic oscillator and cold emission.

Unit-4

12 Hours

Scattering amplitude and scattering cross section:

- Born approximation, application to Coulomb and screened Coulomb potentials.
- Partial wave analysis for scattering, optical theorem, scattering from a hard sphere, resonant scattering from a square well potential.
- Identical particles, Symmetric and antisymmetric wave function, Coulomb and exchange interactions.

Text Book:

1. "Quantum Mechanics: Concepts and Applications" by Nouredine Zettilé John Wiley and sons.

Reference Books:

1. "Quantum Mechanics", L.I. Schiff 3rd Ed, McGraw Hill Book Co.

Tata McGraw Hill.
5. Introduction to Quantum Mechanics, by D.J. Griffiths ,2nd edition ,
Pearson Publications

Sub Code: PHYS P205	Optics (Laboratory work)	
Semester:1	Credit:4	Core Course
Pre-requisites: Basic knowledge of Optics		
Objectives:		
✓ To apply the principle of optics in experiments.		

1. Experiments with optical bench: Biprism Straight edge and narrow wire
 2. Experiments with spectrometer: Single and Double split
 3. Experiments with Michelson interferometer: Determination of λ and α Thickness of mica sheet
 4. Fabry Perot interferometer
 5. Polarization Experiments Babinet compensator Edsar-Butlerbands Quarter wave plate Mallus Law Study of elliptical polarized light
 6. Constant Deviation Spectrography Calibration Zeeman effect
 7. Babinet Quartz Spectrography
 8. Any other suitable experiments
- Any other experiments that may be set up from time to time

Third Semester

Sub Code: PHYS C301	Relativistic Quantum Mechanics & Field theory	
Semester:3	Credit:4	Core Course
Pre-requisites: Quantum Mechanics, Special theory of relativity, Mathematical Physics and Electrodynamics.		
Objectives: <ul style="list-style-type: none">✓ To study the effect of relativity on quantum mechanics and to develop the formulation for Relativistic systems along with the quantization principle.✓ To introduce basic concept of Quantum field theory to understand the dynamics of relativistic systems through creation and annihilation operators		

Unit-1

12Hours

Brief introduction to Relativistic quantum mechanics, Klein-Gordon equation and its drawbacks, Charge and current densities, Positive and negative energy states, Dirac's Hole theory, Free particle Dirac equation, Properties of the Dirac matrices, Continuity Equation, Spin of the electron.

Unit -2

12 hours

Plain wave solutions of Dirac Equation, Normalization of the wave functions, Dirac equation in an electromagnetic field, its non-relativistic correspondence, magnetic moment, Dirac equation for a central potential, spin-orbit coupling, Covariant form of the Dirac equation, Proof of its Lorentz covariance, Properties of the gamma-matrices. Bilinear covariants.

Unit -3

10 hours

Concept of fields, Classical field equation, Noether's theorem and conservation laws, Gauge invariance and charge conservation, Creation, Annihilation and number operators.

Unit -4

14 hours

Field Quantization: (a) neutral scalar meson field (b) charged scalar meson field (c) Dirac field.

Textbooks and reading materials:

1. Relativistic quantum field theory by J.D. Bjorken and S.D. Drell(McGraw-Hill Publisher).
2. Lectures on Quantum Field Theory, Ashok Das, (World Scientific Publishing Co.)

3. Lahiri A, Pal P.B., A First Book of Quantum Field Theory(Narosa Publishing House)
4. Quantum Mechanics and Field Theory by B.K. Agarwal (Asia Publishing House)

Sub Code: PHYS C302	Electronics	
Semester:1	Credit:4	Core Course
Pre-requisites: P.N. Junction. Network Analysis (Kirchhoff Laws)		
Objectives: <ul style="list-style-type: none"> ✓ To make the student familiar with basic analog and digital electronic components. ✓ Understand D.C. analysis and A.C. models of semiconductor devices ✓ Apply concepts for the design of Amplifier ✓ Understand number representation and conversion between different representations in digital electronic circuits ✓ Analyze logic processes and implement logical operations using combinational logic circuits. 		

Unit-1

10 Hours

Amplifiers: Transistors, Two-port network analysis, thevenins theorem, transconductance model, Frequency response of linear amplifiers RC and Transformer coupled amplifiers, gain bandwidth product, feedback amplifiers, effects of negative feedback, FET, MOSFET, Bootstrapping the FET

Unit -2

8 Hours

Oscillator circuits: Feedback criteria for oscillation, Nyquist criterion, Phase shift, Wien-Bridge oscillator, Crystal controlled oscillator

Unit-3

12 Hours

Operational Amplifiers: The differential amplifier, D.C. and A.C. signal analysis, integral amplifier, rejection of common mode signals, CMMR, The operational amplifier, input and output impedances,
Application of operational Amplifiers unit gain buffer, summing, integrating amplifier, Comparator, Operational amplifier as a differentiator

Unit-4**12 Hours**

Digital Circuits: Logic fundamentals, Boolean theorem, logic gates: AND, OR, NOT, NOR, NAND, XOR, and EXNOR. RTL, DTL and TTL logic, Flip-flop, RS and JK-Flip flop, A/D and D/A Convertors

Textbooks and reading materials

1. Electronic fundamental and application by J.D. Ryder, PHI, Learning Pvt Ltd.
2. Electronics: Circuits and Analysis, D.C. Dubey, Alpha Science

References:

1. Foundation of electronics – Chattopadhyay, Rakshit, Saha and Purkait, New age International publisher
2. Electronics principles- Albert Malvino, Tata Mc Graw-Hill Edition
3. Modern Digital Electronics- R.P Jain, Tata Mc Graw-Hill Edition

Sub Code: PHYS C303	Basic Nuclear Physics	
Semester:3	Credit:4	Core Course
Pre-requisites: Quantum mechanics (I and II), Electrodynamics, Mathematical Physics		
Objectives:		
<ul style="list-style-type: none"> ✓ To understand the basic properties of Nucleus and Nuclear matter. ✓ To learn and understand about Deuteron, Scattering, Nuclear energy and Nuclear Model. ✓ To understand the application of Quantum mechanics in Nuclear physics and its correlation with Atomic and Particle Physics 		

Unit -1**12 Hours**

Nuclear properties: Nuclear Radius, Nuclear Mass and Binding Energy, Angular Momentum, Parity and Symmetry, Magnetic Dipole Moment and Electric Quadrupole Moment.

Two nucleons Bound state problem: Central and non-central force, the deuteron, tensor forces, magnetic moment and quadrupole moment of deuteron

Unit -2**12 Hours**

Nucleon scattering problem: n-p scattering at low energy, scattering cross section and scattering length, effective range theory.

Nuclear force: Meson theory of nuclear force, Yukawa interaction

Unit-3**12 Hours**

Nuclear reaction and resonances, Breit-Wigner formula for s-waves, compound nucleus. Liquid drop model, Bohr-Wheeler theory of fission, nuclear fusion

Unit -4**12 Hours**

Single particle model of nucleus, magic numbers, spin-orbit coupling, angular moment and parities of nuclear ground states, magnetic moments and Schmidt lines, Collective model of Bohr and Mottelson.

Text Book:

1. Nuclear Physics by R.R. Roy and B.P. Nigam (John Wiley)
2. Nuclear Physics by D.G Tayal, Himalaya Publishing House
3. Nuclear Physics by S.N. Ghoshal, S.Chand

Reference books:

1. Physics of the nucleus by M.A. Preston (Addison Wesley)
2. Nuclear Physics by S.S.M. Wong (Prentice Hall)
3. Introduction to Nuclear Physics by H. A. Enge (Addison Wesley)

Sub Code: PHYS C304	Condensed Matter and Material Physics	
Semester:3	Credit:4	Core Course
Pre-requisites: Basic knowledge in solid state physics, Classical mechanics, Quantum mechanics and elementary mathematics to handle model description based on physical laws		
Objectives:		
<ul style="list-style-type: none"> ✓ To provide an introduction to the physics of condensed Matters ✓ To make them acquainted with the areas like quantization of lattice vibrations, electron–electron interaction, superconductivity and Advanced Superconductivity. 		

Unit-1

12 Hours

Quantisation of lattice vibration: Phonons, normal coordinate transformation, creation and annihilation operators. Methods of band calculation-Tight binding method, OPW and pseudo potential methods. Fermi Surface, de Haas-van Alphen effect. Transport theory-Boltzmann equation, relaxation time approximation, electrical conductivity and thermal conductivity.

Unit-2

12 Hours

Electron-electron interaction:Hartree approximation, Hartree-Fock approximation, Hartree-Fock theory for jellium model. Density functional theory-general formulation, Local Density Approximation.

Unit-3

12 Hours

Superconductivity: Occurrence of superconductivity, Meissner effects, Type- I and II superconductors, energy gap, Isotope effect, Theoretical survey: Thermodynamics of superconducting transition, London equations, coherence length, Qualitative ideas about the BCS theory, Single particle tunneling, Josephson effect.

Unit-4

12 Hours

Advanced Superconductivity: Electron-phonon interaction, Microscopic theory of superconductivity, Quasi electrons, Cooper pairs, BCS theory, Ground State of superconducting electron gas, elementary ideas of high T_c superconductors

Text Book:

1. Physics of Condensed Matter By Prasanta K. Misra(Academic Press, 2010)
2. Quantum Theory of Solid State by J.Callaway(Academic Press)

Reference books:

1. Principles of the theory of solids, J. M. Ziman(Cambridge and University press)
2. Solid State Physics by C. Kittel (John Wiley and sons, Ins Singapore)
3. Introduction to the theory of Solid State Physics by J. D. Patterson (Addison- Wesley,1971)

Sub Code: PHYS E305	Nuclear Science-I	
Semester:1	Credit:4	Elective course
Pre-requisites: Basic Nuclear Science		
Objectives:		
✓ To understand the advance of Nuclear Physics		

Unit-1

12 Hours

Rotationam Matrix and Tensor: Rotational invariance in three dimensions, eigen values and eigen functions of angular momentum operators, explicit representation of the rotation matrices, addition of angular momenta, Clebsch-Gordon coefficients, irreducible spherical tensor, matrix element of tensor operators, Wigner-Eckart theorem

Unit-2

12 Hours

Optical model: Optical model, deuteron stripping and pick-up reaction, Elementary ideas of Brueckner theory

Unit-3

12 Hours

Collective Model: Collective Vibrational modes of a spherical nucleus, collective oscillations, quadruple deformation, Expression for moment of inertia.

Unit-4

12 Hours

Rotational Spectra: Rotational spectra of even-even nuclei, coupling of a particle and collective motion, electric quadruple moments, magnetic dipole moments

Textbooks:

1. Nuclear Physics by R.R. Roy and B.P. Nigam, John Wiley

Reference Books:

1. Physics of the nucleus by M.A. Preston, Addison Wesley.
2. Nuclear Physics by S.S.M. Wong, Prentice Hall.
3. Introduction to Nuclear Physics by H. A. Enge, Addison Wesley
4. Structure of the Nucleus by M. A. Preston and R K Bhaduri, Addison Wesley

Sub Code: PHYS P306	Modern Physics (Laboratory work)	
Semester:1	Credit:4	Core Course
Pre-requisites: Basic knowledge of Modern Physics		
Objectives:		
✓ To design and analyze experiments in Modern Physics		

1. Determination of e/m by
 - I) Braun tube method
 - II) Magnetron Valve method
 2. Determination of Planck's constant (h) by Photo-electric effect methods
 3. Measurement of velocity of light by Lecher wire
 4. GM counter experiments:
 - I) Characteristics of the Geiger tube
 - II) Inverse Square Law.
 - III) Absorption coefficient of the Aluminium foil.
 5. Characteristics of Diode and Zener diode.
 6. Study of logic gates AND, OR, NOT, NAND, NOR, EXOR .
 7. Making AND, OR, NOT Gates using NAND Gates.
 8. Verification of Boolean Algebra.
 9. Verification of Dual nature.
 10. Characteristics of FET (Field Effect Transistor).
- Any other experiments that may be set up from time to time

Fourth Semester

Sub Code: PHYS E401	Elementary Particle Physics	
Semester:4	Credit:4	Elective Course
Pre-requisites: <ul style="list-style-type: none">✓ Basic knowledge in Quantum mechanics,✓ Relativistic QuantumMechanics		
Objectives: <ul style="list-style-type: none">✓ The main goal of particle physics is to learn about the universe around us.✓ Over the past half century, particle physicists have formulated the Standard Model, a beautiful framework that explains the visible universe from the smallest to the largest scales.		

Unit-1

12 Hours

Historical introduction to the Elementary Particles, Classification of elementary particles and their interactions: Photons, Leptons, Quarks, Mesons, Baryons. Lepton number, Baryon number, color quantum number, Strangeness quantum number.

Unit-2

12 Hours

Charge independence of nuclear forces, Isospin, Test for isospin conservation, Associated Production of Strange particles, Gell-Mann Nishijima scheme, conservation laws in relation to particle reactions and decays.

Unit-3

12 Hours

Unitary Symmetry: $SU(2)$, $SU(3)$, Concept of I-Spin, U-Spin, V-Spin, $SU(3)$ Quark model, The Eight-fold way, Mesons and Baryons in the Octet representation. The Baryon Decouplets, Evidence of color, Gell-Mann–Okubo mass formula.

Unit-4

12 Hours

Discrete Symmetry:

Parity (P) : Parity in quantum mechanics and Field theories, Test of Parity. Time reversal (T) : Time reversal in quantum mechanics and Field theories , Test of Time reversal Charge conjugation (C) : Additive quantum number, Charge conjugation in field theories, Test of Charge conjugation . CPT theorem and its consequences

Text Book:

1. "Introduction of Elementary Particles", D.Griffith , John Wiley
2. "Quarks and Leptons" Halzen, F. and Martin, A.D., John Wiley
3. "Gauge theory of Elementary Particle, T.-P. Cheng and L.-F.Li, Physics"Oxford University Press
4. S Gasiorowicz ".Elementary particle physics" by. John Wiley & Sons .
5. Modern Elementary Particle Physics by G.Kane, Addison-Wesley Publishing Company
6. Mark Thomson " Modern Particle Physics " Cambridge University Press.

Sub Code: PHYS E402	General Theory of Relativity (GTR)	
Semester:4	Credit:4	Elective
Pre-requisites: : Tensor algebra, Quantum Mechanics		
Objectives:		
<ul style="list-style-type: none"> ✓ To learn about the advances in General Theory of Relativity. ✓ It will give the basic knowledge of Gravity as a geometry of space-time, gravitational waves and the formation of astrophysical objects. 		

Unit-1**12 hours**

Special theory of relativity: Lorentz transformations; 4-vectors, Tensors and it's transformation properties, Contraction, Symmetric and antisymmetric tensors; 4-dimensional velocity and acceleration; four-momentum and four-force; Covariant equations of motion; Relativistic kinematics (decay and elastic scattering); Lagrangian and Hamiltonian of a relativistic particle.

Unit-2**12 hours**

The Equivalence Principle, The Weak and Strong Principle of Equivalence, The Equation of Motion in presence of Gravitational Forces, The affine connection, The Metric Tensor g_{uv} , Relation between Metric Tensor and Affine Connection, The transformation of Affine Connection, Covariant derivatives.

Unit-3**12 hours**

The Newtonian Limit: Relation between g_{00} and the Newtonian potential, Time Dilation in a Gravitational Field, Red shift of spectral lines, The Solar Red Shift.

Unit-4**12 hours**

Definition of Curvature tensor, Algebraic Properties of the curvature Tensor, Ricci Tensor and Curvature Scalar, Bianchi identities. Einstein's field Equations, Energy, Momentum and Angular momentum of gravitation.

Textbooks and reading materials:

1. Special theory of relativity, Robert Resnick (Oxford University)
2. Gravitation and Cosmology by Steven Weinberg (Jon Wiley and Sons)

References:

1. Introducing Einstein's Relativity by Ray D Inverno (Clarendon Press)
2. An Introduction to General Relativity and Cosmology by Tail. Chow, (Springer)
3. Principles of Cosmology and Gravitation by M. Berry (Cambridge University)
4. Special theory of relativity, Robert Katz D. Van (Nostrond Company, INC

Sub Code: PHYS E403	Fiber Optics and Optoelectronics	
Semester:4	Credit:4	Elective Course
Pre-requisites: Basic Physics at the higher secondary level		
Objectives: <ul style="list-style-type: none"> ✓ The objective of this course is to familiarize students the role of fiber optics in day today applications. ✓ To provide basic knowledge for designing simple experiment using LED,Fiber and Detector 		

Unit- 1**12 Hours**

Optical fiber:Optical fiber structure: Step Index Fiber, Graded Index Fiber, Transmission of light through cylindrical waveguide by using electromagnetic theory. Single mode and multimode fibers, modal concept, modes in step index and graded index fiber,V-number, power flow in Step Index fiber. Different types of fiber, Elementary idea on Fiber Materials, Fabrication

method: Double Crucible Method, fiber optic Cables, Photonic crystal fiber and Fiber Bragg Grating

UNIT-2

10 Hours

Signal degradation in Optical Fiber: Attenuation, Absorption, bending Loss, Scattering Loss, Core Cladding losses, dispersion losses, Material dispersion, waveguide dispersion, Modal dispersion, Signal distortion in single mode fibers, Design of optimization of single mode fibers. Dispersion shifted and Dispersion flattened fiber.

Unit-3

08 Hours

Connector, Couplers and Splices: Connector and splice, losses during coupling between source fibers, fiber to fiber, Lensing scheme for coupling improvement, Joint losses, multimode fiber joints, single mode fiber joint, Fusion splice, Mechanical Splices, Multimode splices, connector and coupler

Unit-4

12 Hours

Optical Source and Photodetector: Principle of optical sources, Source material, Choice of materials, Integral and external quantum efficiency of LED, Structures, Types of LED: Surface emitting LED, Edge emitting LED, Modulation capability, emission pattern, power bandwidth product, laser Diode Modes, Threshold condition, resonant frequency, Laser Diode Structure, Brief description of principle of optical detectors, Photomultipliers P.N., PIN and APD configuration, Photodetector noise, Noise sources, SNR, Detector response time

Textbooks:

1. R.P.Khare, Fiber Optics and Optoelectronics, Oxford University Press
2. Ajoy Ghatak and K. Thyagarajan, An Introduction to Fiber Optics, Cambridge University Press

Reference Books:

3. G. Keiser, Optical Fibre Communications, Mc-Graw-Hill.
4. J.M.Senior, Optical Fibre Communications Principles and Practice, PHI.

Sub Code: PHYS E404	Environmental Physics	
Semester:4	Credit:4	Elective
Pre-requisites: Basic knowledge in Science		
Objectives: ✓ To understand the basic knowledge of Science of environment		

Unit-1

10 Hours

The human environment: Laws of thermodynamics: First law, Second law and third law of thermodynamics, Laws of thermodynamics and the human body, Energy and metabolism: First law of thermodynamics and the human body, Second law of thermodynamics and the human body, Energy transfers: Conduction, Convection, Radiation, Evaporation, survival in cold climates, Survival in hot climates

Unit-2

10 Hours

Atmosphere and radiation:Structure and composition of the atmosphere: Residence time Photo chemical pollution, Atmospheric aerosol, Atmospheric pressure, Escape velocity, Ozone : Ozone hole ,Ozone in polar region, Terrestrial radiation, Earth as a black body: Greenhouse effect, Greenhouse gases, Global warming.

Unit- 3

10 Hours

Wind: Measuring the wind, Physics of wind creation: Principal forces acting on air masses Gravitational force, Pressure gradient, Coriolis inertial Force, Frictional force, Cyclones and anticyclones : Global convection, Global wind patterns.

Unit-4

10 Hours

Energy for living:Fossil fuels, Nuclear power, Renewable resources: Hydroelectric power, Tidal power, Wind power, Wave power, Biomass, Solar power, Solar collector, Solar photovoltaic

Sub Code: PHYS E405	Atomic and Molecular Spectra	
Semester:4	Credit:4	Elective
Pre-requisites: Basic knowledge in Quantum Mechanics-I, Modern Physics, Basic Nuclear Physics		
Objectives:		
<ul style="list-style-type: none"> ✓ To understand different atomic models and their developments ✓ To learn behavior of atom and molecules in the presence of electric and magnetic field and molecular vibration. ✓ To understand atomic and molecular spectra 		

Unit-1

12 Hours

Revision of Hydrogen atom; Bohr-Summerfield Theory, quantum theory of hydrogen atom, wave functions, orbital and spin angular momentum, magnetic dipole moment, spin orbit interaction, fine structure, spectroscopic term and notation. Hydrogen fine structure. Spectrum of Helium.

Unit-2

12 Hours

Hartrees' central field approximation, atomic orbital and Hund's rule. L.S and J.J Coupling

Unit-3

12 Hours

Normal and Anomalous Zeeman effect, Explanations of Zeeman Effect in some transitions. Paschen-Bach Effect Stark-Effect: Weak field and strong field Stark effect in hydrogen. Hyperfine structure and isotope effect, Nuclear spin and hyperfine structure.

Unit-4

12 Hours

Types of molecular spectra, Electronic spectra, Vibrational-Rotational spectra, molecule as a harmonic and non-harmonic oscillator, Pure Rotational Spectra, molecule as a rigid and non-rigid rotator .The Raman spectra and molecular structure.

Text Book:

1. Atomic and Molecular spectra : Laser by Raj Kumar
2. Introduction to atomic spectra by H. E. White

Reference books:

1. The Fundamentals of Atomic and Molecular Physics by L.Robert, Springer

Sub Code: PHYS P406	Project and Seminar	
Semester:4	Credit:4	PROJECT
Objectives:		
<ul style="list-style-type: none"> ✓ The main objective of this course is to work in a mini project , learn about how to prepare a research report and present before an audience. 		

Sub Code: PHYS E407	Condensed Matter and Materials Physics	
Semester:4	Credit:4	Elective
Pre-requisites: Basic Solid State Physics		
Objectives:		
<ul style="list-style-type: none"> ✓ The main objective of this course is to learn about optical and magnetic properties of materials and their response to internal and external stimuli 		

Unit-1**12 Hours**

Optical properties: Absorption, intraband and inter band transition, Absorption spectra of materials, Luminiscence, Fluorescence, phosphorescence, Colour centres, Optical fibres (elementary ideas). Basic principles of Electron Spin Resonance, NMR and Lasers-principles,

Induced absorption, Spontaneous Emission and stimulated Emission, Einstein A and B Coefficients, Ruby laser, Helium-Neon Laser and Semiconducting Laser .

Unit-2

12 Hours

Magnetism: Langevin Diamagnetism and Van Vleck Paramagnetism, Paramagnet: Derivations of Curie law, Pauli paramagnetic susceptibility, Ferromagnetism: Curie point and the exchange interaction, Curie-Weiss law, Ferrimagnetic order, Curie temperature and susceptibility of ferrimagnets, Antiferromagnetic order, susceptibility below the Neel temperature.

Unit-3

12 Hours

Advanced magnetism and materials: Landau's theory of diamagnetic susceptibility, Spin waves and magnon specific heat, NMR Knight shift, Diluted magnetic and ferromagnetic semiconductors Spintronics-giant magneto Resistance (GMR), Mott's theory of spin-dependent scattering of electrons

Unit-4

12 Hours

Novel Materials: Metallic nano clusters: Nano science and nano clusters, liquid drop model, size and surface volume ratio. Graphene: Graphene lattice, tight binding approximation, Dirac Fermions Elementary ideas about polymers, Characterisation of materials: Experimental diffraction methods, Bragg law, Laue conditions, Geometrical Structure factor and Atomic form factor, Non-crystalline materials-diffraction pattern, amorphous semiconductors, low energy excitations, heat capacity, thermal conductivity. Basic principles of Raman Effect in crystals and Mossbauer techniques

Text Books:

1. Physics of Condensed Matter- PrasantaK.Misra (Academic Press, 2010)
2. Optical Properties of Solids, MarkFox, Oxford University Press

References:

2. Introduction to Solid State Physics , C. Kittel, John Wiley and Sons, Inc. Singapore.
3. Solid state Physics by Aschcroft and Mermin, Harcourt Asia PTE. Ltd. (A Harcourt publishers International company)

Sub Code: PHYS E408	Nuclear Science-2 (Field Theory and Particle Physics)	
Semester:4	Credit:4	Elective
Pre-requisites: Quantum Field theory, Elementary Particle Physics and Mathematical Physics.		
Objectives:		
<ul style="list-style-type: none"> ✓ To learn the field theoretic techniques as applicable to the interacting elementary particles and to be conversant with the current status of particle physics. ✓ To learn the fundamental concept of spontaneous breaking on the basis of weak interaction along with decay width calculation. 		

Unit-1

12 hours

Field Theory:

Unequal space time commutation and anti-commutation rules for field operators. Propagator functions and their integral representations, Vacuum expectation values, Feynman propagators, Concept of T-Product and Normal Product, Feynman diagram rules in co-ordinate and momentum space, Wick's Theorem, Properties of scattering matrix, Brief idea of electron-photon scattering.

Unit-2

12 hours

Particle Physics:

Brief review of elementary particles and their interactions, SU(3) Quark Model, The Baryon and Meson State, Baryon-Meson coupling: The F and D terms, Gell-Mann-Okubo mass formula. The Heavy Quarks: Charm and Beyond, SU(6) Quark Model: wave-function for Mesons and Baryons, Magnetic moment of Baryons.

Unit-3

12 hours

Weak Interaction :V-A form of weak interaction, , Muon and Pion decay calculation, elementary notion of leptonic decays of strange particles, the Cabibbo angle, intermediate vector bosons, Elements of Neutral K-meson theory : Decay of Neutral K-mesons, regeneration of K-mesons, CP violation in neutral K decay.

Unit-4**12 hours**

Spontaneous symmetry breaking, Higgs Mechanism, Brief idea of Salam-Weinberg Theory of Standard Model. Neutrino Physics: Neutrino Mass and Experimental limits, Neutrinoless Double-Beta decay, Neutrino oscillation, Solar neutrino puzzle, Magnetic moment of neutrino.

Textbooks and reading materials

1. Introduction to Elementary Particles by D.Griffiths, John Wiley & sons.
2. Relativistic quantum field theory by J.D. Bjorken and S.D. Drell, Mc Graw-Hill Book Company.
3. An Introductory Course of Particle Physics, Palas.B.Pal. C.R.C. Press.
4. Elementary particle physics by Gasiorwicz, Addison-Wesley publishing Company
5. Elementary Particle Physics by G.Kallen, Addison-Wesley publishing Company
6. Quarks and Leptons: F.Halzen and A.D.Martin, John Wiley.
7. A Modern introduction to particle physics : Fayyazuddin and Riazuddin, World Scientific, Singapore.

Sub Code: PHYS P409	CONDENSED MATTER & MATERIALS PHYSICS	
	(Laboratory work)	
Semester:1	Credit:4	Elective Course
Pre-requisites: Basic knowledge of Condensed Matter and Materials Physics		
Objectives:		
✓ To design and analyze principles in Condensed Matter and Materials Physics.		

1. Determination of energy gap of a given semiconductor by four probe method
 2. Determination of Hall constant of a sample and its identification
 3. Determination of energy gap by p-n junction method
 4. Study of dispersion relation of an electric analog of mono atomic linear chain
 5. Study of dispersion relation of an electric analog of diatomic linear chain
 6. Determination of specific heat of a given sample using a thermocouple
 7. Determination of dielectric constant of a given sample by lecher wire method
 8. Determination of B-H curve of a given ferromagnet
- Any other experiments that may be set up from time to time.

Sub Code: PHYS P410	Nuclear Science (Laboratory work)	
Semester:1	Credit:4	Elective Course
Pre-requisites: Basic knowledge of Condensed and Material Physics		
Objectives:		
✓ To design and analyze experiments in Nuclear Science		

1. Determination of half-life of unknown source
2. Determination of linear absorption coefficient
3. Verification of inverse square law
4. Experiment with gamma ray spectrometer
 - i. Energy analysis of unknown gamma source
 - ii. Spectrum analysis of ^{60}Co and ^{137}Co
 - iii. Activity of Gamma emitter
5. High resolution of gamma ray spectroscopy Energy resolution with Ge (Li) detector
Photo pick efficiency for Ge(Li) detector

Any other experiments that may be set up from time to time
